

This code is a sector area calculator that computes the area of a sector of a circle using the given radius and central angle. The program takes user inputs, applies the sector area formula, and displays the calculated area in square units.

```
In [ ]: # 1. Data
radius = input("Enter Radius of Circle: ")
angle = input("Enter Angle: ")
pi = 3.14159

x = float(radius)
y = float(angle)

# 2. Formula
sectorarea = (y/360)*pi*(x**2)

# 3. Area of the Sector
print("The area of the sector is:", (y/360)*pi*(x**2), "unit squared")
```
